

Phase 1: Authentication & Role-Based Access Control (RBAC)

Your sketch clearly maps out the user hierarchy. The first technical milestone is setting up a secure authentication flow that routes users based on these specific roles.

Visitor: Unauthenticated users who can only view public information (e.g., list of clubs, public events).

User Registration: The gateway where a visitor creates an account to become a recognized entity in the system.

Role Assignment Middleware: Logic to route the authenticated user into one of the three primary buckets shown in your diagram:

General user (Standard student accounts).

Club management (Club presidents, secretaries, or designated executives).

Platform admin (You or a top-level administrative body).

Phase 2: Database Schema Design

On the top right of IMG_20260813_204318_920.jpg, you have started noting data types (id, int, char). You will need a relational structure to link students to their respective clubs.

Users Table: user_id, name, student_id, email, role_id, password_hash.

Clubs Table: club_id, club_name, description, created_at.

Roles Table: role_id, role_name (Admin, Club Manager, General).

Memberships (Junction Table): user_id, club_id, status (Pending, Approved).

Phase 3: Dashboard Development (Frontend UI)

The bottom section of your sketch outlines three distinct dashboard views. Building these out as modular components will keep your codebase clean.

General User Dashboard: Needs to display clubs the student is currently a member of, pending join requests, and personalized event notifications.

Club Dash (Management): Needs tools to approve/reject general user join requests, post announcements, and create events for their specific club.

Admin Dashboard: The god-view. Needs the ability to create/delete clubs, assign "Club Management" roles to specific users, and moderate platform-wide content.

Phase 4: Core Functionality Integration

Once the shells of the dashboards are built, you can wire up the primary actions.

Club Discovery & Join Flow: Allow general users to browse available clubs and hit a "Request to Join" button.

Event Management: Allow club managers to post upcoming meetings or events that show up on the general users' feeds.

Profile Management: Allow users to update their details and manage their credentials.

Phase 5: Testing & Deployment

Role Testing: Rigorously test the RBAC to ensure a general user cannot access a club dash route by manipulating the URL.

Hosting: Deploy the application (using platforms like Vercel, Netlify, or Railway) and test the database connections in a live environment.
